Ceiling mounted air handling units in compact heat- and sound-insulated casing with electric heater. Air capacity up to **4000 m³/h**, heat recovery efficiency up to 90%.

Ceiling mounted air handling units in compact heat- and sound-insulated casing with water heater. Air capacity up to **3800 m³/h**, heat recovery efficiency up to 90%.

■ **Description**

The VUT PE EC air handling unit with electric heater and the VUT PW EC air handling unit with water heater are the fully-featured ventilation units ensure air filtration, fresh air supply and stale air extract. The heat energy contained in extract air is transferred to supply air through the plate heat exchanger.

The units are suitable for integration into various ventilation and air conditioning networks requiring cost-effective solutions and controllable ventilation. The integrated EC motors reduce energy demand by half up to three-fold and provide high air capacity and low noise level. All the models are compatible with round 160 (150), 200, 250, 315 and 400 mm air ducts.

■ **Modifications**

VUT PE EC – models with the electric heater.

VUT PW EC – models with water heater.

■ **Casing**

The aluzinc casing is internally filled with 20 mm mineral wool for VUT 350, 600, 1000 PE/PW EC and 25 mm for VUT 2000, 3000 PE/PW EC units.

■ **Filter**

Supply and extract air flows are purified through two

panel filters with filtering class G4. Supply filter F7 can be supplied with the few models.

■ **Motor**

High-efficient electronically-commutated motors with external motor and impellers with backward curved blades. Such motors are the most state-of-the-art energy-saving solution. EC motors are featured with high performance and total speed controllable range. High efficiency reaching 90% is the premium advantage of the electronically-commutated motors.

■ **Heat exchanger**

VUT 350, 600, 1000 PE/PW EC models are fitted with a counter-flow heat exchanger made of polystyrene. VUT 2000, 3000 PE/PW EC models are fitted with a cross-flow plate heat exchanger made of aluminum. All the units are equipped with a drain pan for condensate drainage.

■ **Heater**

The electric heater (for the unit VUT PE) or the water heater (for the unit VUT PW) the heat exchanger is designed for warming up of supply air up to the set level if heat recovery is not enough to attain the set supply air temperature. The water heaters are designed

for max. operating pressure 1.0 MPa (10 bar) and max. heat medium operating temperature +95 °C.

■ **Control and automation**

The unit includes an integrated automation and a multifunctional control panel with a remote LCD control panel.

▶ The VUT PE/PW EC unit incorporates a LCD control panel with a colour sensor display PU SENS 01.

▶ The VUT PE/PW ECA7 unit incorporates a monochrome LCD display PU JK 01.

The PU SENS 01 and PU JK 01 are interchangeable.

The delivery set includes a 10 m connecting cable for connection of the unit to the control panel. The freezing protection function is performed by means of the bypass and the heater.

In case of a freezing danger according to the temperature sensor readings the bypass damper is opened to let supply air flow through the bypass duct and not come in contact with the heat exchanger. The heater warms up supply air up to the required temperature and meanwhile the heat exchanger is heated by the

warm extract air. After the heat exchanger defrosting the bypass damper closes the bypass duct and the air handling unit reverts to the standard operation mode.

VUT PE EC control and protection functions

Via control panel:

- ▶ turning air handling unit on/off, room temperature indication, low-medium-high speed selection;
- ▶ opening/closing bypass for summer ventilation; timer mode activation, setting week scheduled operation (applicable only for PU SENS 01);
- ▶ supply and exhaust fan speed stage adjustment from 0 up to 100% during the system set-up;
- ▶ set indoor air maintaining by feedback of the sensor on the control panel;
- ▶ overheating protection for the electric heating elements according to feedback of the duct temperature sensor as well as signal from the two thermal switches, one of self-resetting type actuated at +60°C and the other one of manual reset type actuated at +90°C;
- ▶ cooling of the electric heating elements at the end of the heating cycle;
- ▶ actuating external air dampers;
- ▶ maintaining set indoor or room air temperature;
- ▶ control according to the duct humidity sensor feedback HV1 (special accessory) or according to the humidity sensor in the control panel;

- ▶ filter clogging control by motor hours;
- ▶ ventilation system shutdown at signal from the fire alarm system;
- ▶ cooler connection possibility.

VUT PW EC control and protection functions

Via control panel:

- ▶ turning air handling unit on/off, room temperature indication, low-medium-high speed selection;
- ▶ setting week-scheduled operation;
- ▶ supply and exhaust fan speed stage adjustment from 0 up to 100% during the system set-up;
- ▶ maintaining set supply air temperature by means of controlling the circulating pump and heat medium regulating valve of the water mixing unit;
- ▶ heater freezing protection according to the feedback of the temperature sensor at outlet of the heater and of the return heat medium temperature sensor;
- ▶ safe fan start/shutdown;
- ▶ return heat medium temperature maintenance during the fan standby;
- ▶ actuating external air dampers;
- ▶ maintaining set indoor or room air temperature;
- ▶ control according to the duct humidity sensor feedback HV1 (special accessory) or according to the humidity sensor in the control panel;
- ▶ filter clogging control by motor hours;
- ▶ ventilation system shutdown on signal from the fire alarm system;

- ▶ cooler connection possibility.

Mounting

The unit is designed for indoor mounting. While mounting the unit ensure its correct position to enable condensate collection and drainage. Access for servicing and cleaning of the filter is from the right or left side panel for the dimension types 350, 600 and 1000 and from the bottom for the dimension types 2000 and 3000.

Accessories

For attenuation of sound generated by the fans it is recommended to install the duct silencer (refer SR) from inside before the unit. For absorbing of vibration in the air duct it is recommended to install the flexible anti-vibration connectors (refer VVG) on both sides of the unit.

To disable uncontrollable air during the fan standby and to prevent the water heater freezing the units are recommended to be equipped with automatic air dampers.

The mixing units USWK are recommended for smooth supply air temperature regulation in the units with water heaters. The mixing unit USWK with three-way heat medium regulating valve and circulation pump provides smooth heating capacity regulation and minimizes the water heater freezing danger.

Hot water coil parameters:

VENTS VUT PW EC

How to use water heater diagrams

System Parameters: Air flow = 400 m³/h. Outside air temperature = -20 °C. Water temperature (in/out) = 70/50 °C.

- Supply air temperature. Prolong the line of air flow (e.g., 400 m³/h) ① up to the point where it crosses the outside air temperature (blue curve, e.g., -20 °C); then draw a horizontal line ② from this point to the left till crossing water in/out temperature curve (e.g., 70/50 °C). From this point draw a vertical line ③ to the supply air temperature axis on top of the graphic (+23 °C).
- Heating coil capacity. Prolong the line ① up to the point where it crosses the outside air temperature (e.g., -20 °C, red curve) and draw a horizontal line ④ from this point to the right until it crosses water in/out temperature curve (e.g., 70/50 °C), from here draw a vertical line ⑤ up to the scale representing the heating coil capacity (6.6 kW).
- Water flow. Prolong the line ⑤ down to water flow axis at the bottom of the graphic ⑥ (0.105 l/s).
- Water pressure drop. Draw the line ⑦ from the point where the line ⑥ crosses the black curve to the pressure drop axis. (8.5 kPa).

VENTS VUT PW EC

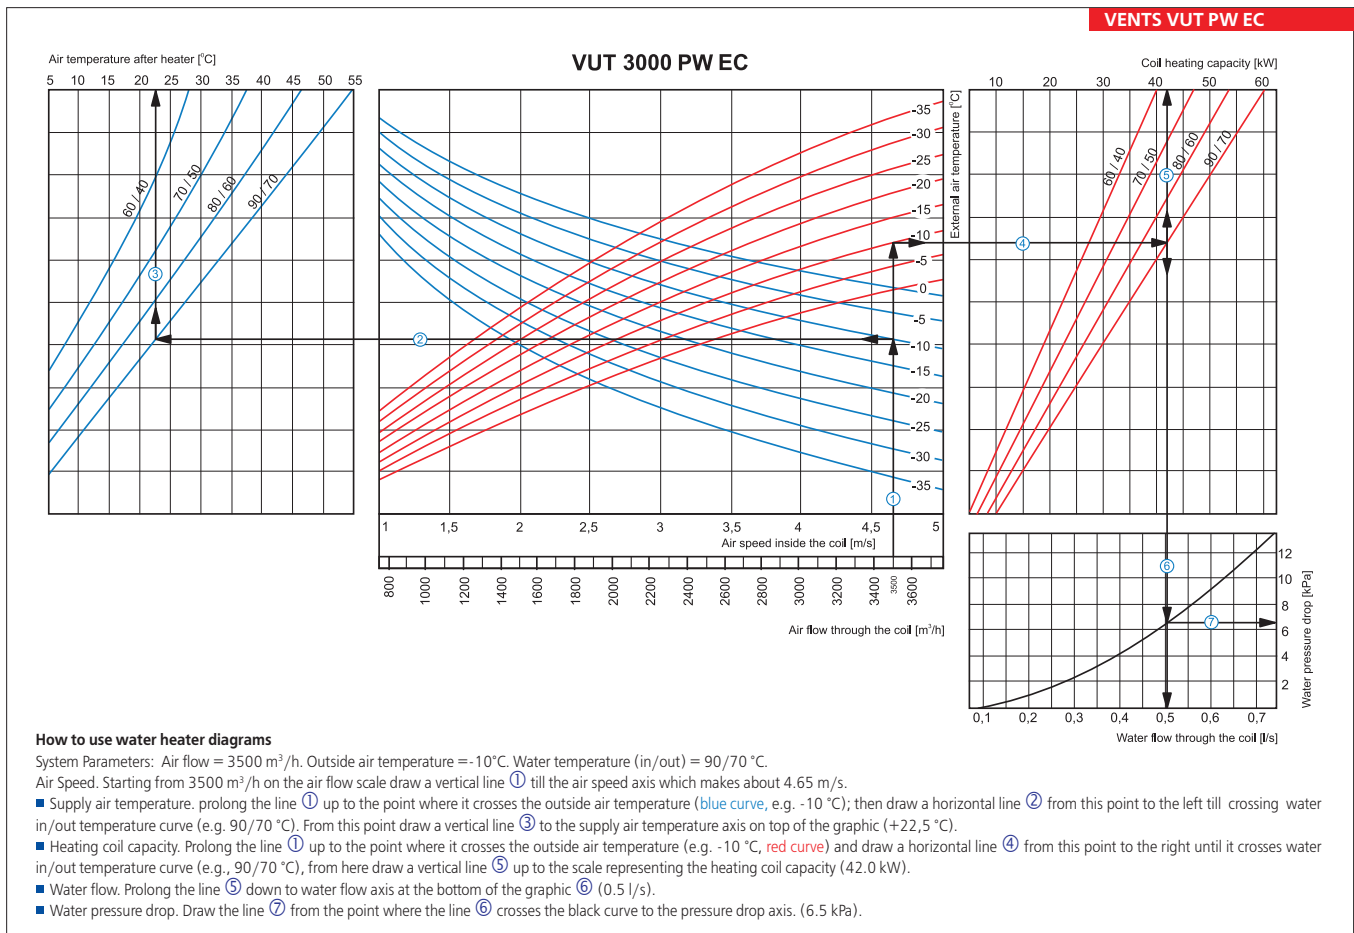

How to use water heater diagrams

Air Speed. Starting from 950 m³/h on the air flow scale draw a vertical line ① till the air speed axis which makes about 3.35 m/s.

- Supply air temperature. Prolong the line ① up to the point where it crosses the outside air temperature (blue curve), e.g., -15 °C; then draw a horizontal line ② from this point to the left till crossing water in/out temperature curve (90/70 °C). From this point draw a vertical line ③ to the supply air temperature axis on top of the graphic (+23 °C).
- Heating coil capacity. Prolong the line ① up to the point where it crosses the outside air temperature indicated as red curve (e.g., -15 °C) and draw a horizontal line ④ from this point to the right to the intersection of water in/out temperature curve (e.g., 90/70 °C). From this point draw a vertical line ⑤ up to the scale of heating coil capacity (13.5 kW).
- Water flow. Prolong the line ⑤ down to water flow axis at the bottom of the graphic ⑥ (0.14 l/s).
- Water pressure drop. Draw the line ⑦ from the point where line ⑥ crosses the black curve to the pressure drop axis. (1.5 kPa).
